E451: Operating rotation matrices on spin states (2002A2)

Submitted by: Adam Reichenthal

The problem:

Find the state vector Ψ_m in the standard base for a spin polarized in the XY plane at angle $\varphi = 60°$. Relate to the following cases:

(1) Spin 1/2.
(2) Spin 1 with circular polarization.
(3) Spin 1 with linear polarization.

You must express the elements of the state vector in your final answer with $e^{i\pi/integer}$, $\sqrt{2}$ etc.
In order to prevent losing all points because of an algebraic mistake, please write first the analytic formula and only after calculate it to receive your final answer.

The solution:

(1) We can receive any spin 1/2 polarization state by combining a rotation round the Y axis and a rotation round the Z axis. The result is:

$$|\vec{e}_{\theta,\varphi}>= R(\varphi)R(\theta)|\uparrow>= e^{-i\varphi S_z}e^{-i\theta S_y}|\uparrow>\rightarrow \begin{pmatrix} e^{-i\varphi/2}cos(\theta/2) \\ e^{i\varphi/2}sin(\theta/2) \end{pmatrix}$$

The rotation action that has been done on the spin 1/2 up is a rotation by $\theta = \pi/2$ round the Y axis and after that a rotation by $\varphi = \pi/3$ round the Z axis. Therefore:

$$|\Psi_m >= e^{-i(\pi/6)}cos(\pi/4)|\uparrow> +e^{i(\pi/6)}sin(\pi/4)|\downarrow>$$

Analytic result:

$$\Psi_m = \begin{pmatrix} e^{-i\frac{\pi}{6}}cos(\frac{\pi}{4}) \\ e^{i\frac{\pi}{6}}sin(\frac{\pi}{4}) \end{pmatrix} = \frac{1}{\sqrt{2}}\begin{pmatrix} e^{-i\frac{\pi}{6}} \\ e^{i\frac{\pi}{6}} \end{pmatrix}$$

(2) We will use a similar technique as at (1) once again but this time using dim=3 rotation matrices to be able to take care of spin 1 and using the linear basis.

We can rotate the state $|\Uparrow>$ in order to get other circularly polarized states:

$$|\vec{e}_{\theta,\varphi}>= U(\varphi\vec{e}_z)U(\theta\vec{e}_y)|\Uparrow>= e^{-i\varphi S_z}e^{-i\theta S_y}|\Uparrow>\rightarrow \begin{pmatrix} \frac{1}{2}(1+cos\theta)e^{-i\varphi} \\ \frac{1}{\sqrt{2}}sin\theta \\ \frac{1}{2}(1-cos\theta)e^{i\varphi} \end{pmatrix}$$

The rotation action that has been done on the spin 1 up is a rotation by $\theta = \pi/2$ round the Y axis and after that a rotation by $\varphi = \pi/3$ round the Z axis. Therefore:

$$|\Psi_m >= \frac{1}{2}(1+cos(\pi/2))e^{-i\pi/3}|\Uparrow> +\frac{1}{\sqrt{2}}sin(\pi/2)|\Updownarrow> +\frac{1}{2}(1-cos(\pi/2))e^{i\pi/3}|\Downarrow>$$

Analytic result:

$$\Psi_m = \frac{1}{2}\begin{pmatrix} e^{-i\frac{\pi}{3}} \\ \sqrt{2} \\ e^{i\frac{\pi}{3}} \end{pmatrix}$$

(3) Using the same technique as in (2) this time with a rotation matrix that rotates the state $|\Updownarrow>$ in order to get other linearly polarized states:

$$|\vec{e}_{\theta,\varphi}>= U(\varphi\vec{e}_z)U(\theta\vec{e}_y)|\Updownarrow>= e^{-i\varphi S_z}e^{-i\theta S_y}|\Updownarrow>\rightarrow \begin{pmatrix} -\frac{1}{\sqrt{2}}sin\theta e^{-i\varphi} \\ cos\theta \\ \frac{1}{\sqrt{2}}sin\theta e^{i\varphi} \end{pmatrix}$$

We receive:

$$|\Psi_m>= -\frac{1}{\sqrt{2}}sin(\pi/2)e^{-i\pi/3}|\Uparrow> +cos(\pi/2)|\Updownarrow> +\frac{1}{\sqrt{2}}sin(\pi/2)e^{i\pi/3}|\Downarrow>$$

Analytic result:

$$\Psi_m = \frac{1}{\sqrt{2}}\begin{pmatrix} -e^{-i\frac{\pi}{3}} \\ 0 \\ e^{i\frac{\pi}{3}} \end{pmatrix}$$
